Biology

The **Barred Yellow** is distributed in North, Central and South America. In the United States, it can be found as far north as New York and South Dakota. The **Barred Yellow** frequents pastures, pine lands and open areas. Adult males have black bands on the inner margin of the forewing, while females do not. The **Barred Yellow** has two seasonal forms: the summer form is smaller and its underside is lighter. Eggs are white and are laid singly. Larvae are green. Pupae are pale yellow-brown in color, and camouflaged as leaves. In Gainesville, there are other similar species to the **Barred Yellow**: the Little Yellow, *Eurema lisa* and the Sleepy Orange, *Eurema nicippe*

Host Plants

Sticky Jointvetch	<i>Aeschynomene viscidula</i>
Shyleaf	<i>Aeschynomene americana</i>
Sideback Pencilflower	<i>Stylosanthes biflora</i>
Hairy Indigo	<i>Indigofera hirsuta</i>
